CHEMICAL COMPOUNDS

The present invention relates to antibiotic compounds and in particular to antibiotic compounds containing a substituted oxazolidinone ring. This invention further relates to 5 processes for their preparation, to intermediates useful in their preparation, to their use as therapeutic agents and to pharmaceutical compositions containing them.

The international microbiological community continues to express serious concern that the evolution of antibiotic resistance could result in strains against which currently available antibacterial agents will be ineffective. In general, bacterial pathogens may be 10 classified as either Gram-positive or Gram-negative pathogens. Antibiotic compounds with effective activity against both Gram-positive and Gram-negative pathogens are generally regarded as having a broad spectrum of activity. The compounds of the present invention are regarded as principally effective against Gram-positive pathogens.

Gram-positive pathogens, for example Staphylococci, Enterococci, and Streptococci 15 are particularly important because of the development of resistant strains which are both difficult to treat and difficult to eradicate from the hospital environment once established. Examples of such strains are methicillin resistant staphylococcus (MRSA), methicillin resistant coagulase negative staphylococci (MRCNS), penicillin resistant Streptococcus pneumoniae and multiply resistant Enterococcus faecium.

20 The major clinically effective antibiotic for treatment of such resistant Gram-positive pathogens is vancomycin. Vancomycin is a glycopeptide and is associated with various toxicities including nephrotoxicity. Furthermore, and most importantly, antibacterial resistance to vancomycin and other glycopeptides is also appearing. This resistance is increasing at a steady rate rendering these agents less and less effective in the treatment of 25 Gram-positive pathogens. There is also now increasing resistance appearing towards agents such as β -lactams, quinolones and macrolides used for the treatment of upper respiratory tract infections, also caused by certain Gram negative strains including *H.influenzae* and *M.catarrhalis*.

Certain antibacterial compounds containing an oxazolidinone ring have been described 30 in the art (for example, Walter A. Gregory et al in *J.Med.Chem.* 1990, 33, 2569-2578 and Chung-Ho Park et al in *J.Med.Chem.* 1992, 35, 1156-1165). Such antibacterial oxazolidinone compounds with a 5-acetamidomethyl side-chain may be subject to mammalian peptidase metabolism. Furthermore, bacterial resistance to known antibacterial agents may develop, for

- 2 -

example, by (i) the evolution of active binding sites in the bacteria rendering a previously active pharmacophore less effective or redundant, (ii) the evolution of means to chemically deactivate a given pharmacophore and/or (iii) the development and/or up-regulation of efflux mechanisms. Therefore, there remains an ongoing need to find new antibacterial agents with a 5 favourable pharmacological profile, in particular for compounds containing new pharmacophores.

Additionally, certain antibacterial compounds containing an oxazolidinone ring have activity against the enzyme mono-amine oxidase (MAO), for instance compounds with amidomethyl or hydroxymethyl side chains at C-5 of the oxazolidinone ring. This may 10 potentially lead to undesirable properties such as elevation in blood pressure when administered to a patient, or potentially cause drug-drug interactions. Therefore, there remains an ongoing need to find new antibacterial agents of the oxazolidinone class with a more favourable profile against MAO.

We have discovered a new class of antibiotic compounds containing an oxazolidinone 15 ring substituted by a 5-azolylmethyl moiety in which the azole group is linked via a nitrogen atom and is itself further substituted. These compounds have useful activity against Gram-positive pathogens including MRSA and MRCNS and, in particular, against various strains exhibiting resistance to vancomycin and against *E. faecium* strains resistant to both aminoglycosides and clinically used β -lactams, but also to certain fastidious Gram negative 20 strains such as *H.influenzae*, *M.catarrhalis* and chlamydial strains. The compounds of the invention also show a favourable, decreased, MAO potency compared with other oxazolidinone analogues from the prior art.

Accordingly in a first aspect, the present invention provides a compound of the formula (I), or a pharmaceutically-acceptable salt, or an in-vivo-hydrolysable ester thereof,

or R1 is selected from the group
 - (R1b) wherein R1 is a (1-4C)alkyl group which is substituted by one substituent selected from hydroxy, (1-4C)alkoxy, amino, cyano, azido, (2-4C)alkenyloxy, (1-4C)alkylcarbonyl,
- 20 (1-4C)alkoxycarbonyl, (1-4C)alkylamino, (2-4C)alkenylamino, (1-4C)alkyl-SO₂-NH-, (1-4C)alkylcarbonylamino, (1-4C)alkylthiocarbonylamino, (1-4C)alkyl-OCO-NH-, (1-4C)alkyl-NH-CO-NH-, (1-4C)alkyl-NH-CS-NH-, (1-4C)alkyl-SO₂-NH-, (1-4C)alkyl-S(O)q- (wherein q is 0, 1 or 2), (3-6C)cycloalkyl, (3-6C)cycloalkenyl, or an N-linked 5-membered heteroaryl ring, which ring contains either (i) 1 to 3 further
 - 25 nitrogen heteroatoms or (ii) a further heteroatom selected from O and S together with an optional further nitrogen heteroatom; which ring is optionally substituted on a carbon atom by an oxo or thioxo group; and/or the ring is optionally substituted on a carbon atom by 1 or 2 (1-4C)alkyl groups; and/or on an available nitrogen atom (provided that the ring is not thereby quaternised) by (1-4C)alkyl;
- 30 or R1 is selected from a group of formula (R1c1) to (R1c3) :-
 - (R1c1) a fully saturated 4-membered monocyclic ring containing 1 or 2 heteroatoms independently selected from O, N and S (optionally oxidised), and linked via a ring nitrogen or carbon atom; or

- 17 -

(R1c2) a saturated or unsaturated 5-membered monocyclic ring containing 1 heteroatom selected from O, N and S (optionally oxidised), and linked via a ring nitrogen atom if the ring is not thereby quaternised, or a ring carbon atom; or

(R1c3) a saturated or unsaturated 6- to 8-membered monocyclic ring containing 1 or 2 heteroatoms independently selected from O, N and S (optionally oxidised), and linked via a ring nitrogen atom if the ring is not thereby quaternised, or a ring carbon atom; wherein said rings in (R1c1) to (R1c3) are optionally substituted on an available carbon atom by 1 or 2 substituents independently selected from hydroxy, (1-4C)alkoxy, amino, cyano, azido, (2-4C)alkenyloxy, (1-4C)alkylcarbonyl, (1-4C)alkoxycarbonyl, (1-4C)alkylamino, (2-10) 4C)alkenylamino, (1-4C)alkyl-SO₂-NH-, (1-4C)alkylcarbonylamino, (1-4C)alkylthiocarbonylamino, (1-4C)alkyl-OCO-NH-, (1-4C)alkyl-NH-CO-NH-, (1-4C)alkyl-NH-CS-NH-, (1-4C)alkyl-SO₂-NH-, (1-4C)alkyl-S(O)q- (wherein q is 0, 1 or 2), (3-6C)cycloalkyl or (3-6C)cycloalkenyl; or R1 is selected from the group

15 (R1d) cyano, nitro, azido, formyl, (1-4C)alkylcarbonyl or (1-4C)alkoxycarbonyl; and wherein at each occurrence of an R1 substituent containing an alkyl, alkenyl, alkynyl, cycloalkyl or cycloalkenyl moiety in (R1a), (R1b) or (R1c1) to (R1c3) each such moiety is optionally further substituted on an available carbon atom with one or more substituents independently selected from F and Cl and/or by one cyano group;

20 R² and R³ are independently hydrogen or fluoro; and wherein all other groups, variables and substituents are as hereinbefore defined in the first aspect.

It will be noted that in the groups (Ia) to (If) there is no substituent in the position adjacent to the nitrogen link.

25 In this specification, where it is stated that a ring may be linked via an sp² carbon atom it is to be understood that the ring is linked via one of the carbon atoms in a C=C double bond.

In this specification the term 'alkyl' includes straight chained and branched structures. For example, (1-6C)alkyl includes propyl, isopropyl and tert-butyl. However, references to 30 individual alkyl groups such as "propyl" are specific for the straight chained version only, and references to individual branched chain alkyl groups such as "isopropyl" are specific for the branched chain version only. A similar convention applies to other radicals, for example halo(1-4C)alkyl includes 1-bromoethyl and 2-bromoethyl.

- 20 -

cyanopropyl; examples of **(1-4C)alkanesulfonamido** include methanesulfonamido and ethanesulfonamido; examples of **(1-4C)alkylaminosulfonyl** include methylaminosulfonyl and ethylaminosulfonyl; and examples of **di-(1-4C)alkylaminosulfonyl** include dimethylaminosulfonyl, diethylaminosulfonyl and N-methyl-N-ethylaminosulfonyl; examples of **(1-4C)alkanesulfonyloxy** include methylsulfonyloxy, ethylsulfonyloxy and propylsulfonyloxy; examples of **(1-4C)alkanoyloxy** include acetoxy; examples of **(1-4C)alkylaminocarbonyl** include methylaminocarbonyl and ethylaminocarbonyl; examples of **di((1-4C)alkyl)aminocarbonyl** include dimethylaminocarbonyl and diethylaminocarbonyl; examples of **(3-8C)cycloalkyl** include cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl; examples of **(4-7C)cycloalkyl** include cyclobutyl, cyclopentyl and cyclohexyl; examples of **di(N-(1-4C)alkyl)aminomethylimino** include dimethylaminomethylimino and diethylaminomethylimino.

Particular values for AR2 include, for example, for those AR2 containing one heteroatom, furan, pyrrole, thiophene; for those AR2 containing one to four N atoms, pyrazole, imidazole, pyridine, pyrimidine, pyrazine, pyridazine, 1,2,3- & 1,2,4-triazole and tetrazole; for those AR2 containing one N and one O atom, oxazole, isoxazole and oxazine; for those AR2 containing one N and one S atom, thiazole and isothiazole; for those AR2 containing two N atoms and one S atom, 1,2,4- and 1,3,4-thiadiazole.

Particular examples of AR2a include, for example, dihydropyrrole (especially 2,5-dihydropyrrol-4-yl) and tetrahydropyridine (especially 1,2,5,6-tetrahydropyrid-4-yl).

Particular examples of AR2b include, for example, tetrahydrofuran, pyrrolidine, morpholine (preferably morpholino), thiomorpholine (preferably thiomorpholino), piperazine (preferably piperazino), imidazoline and piperidine, 1,3-dioxolan-4-yl, 1,3-dioxan-4-yl, 1,3-dioxan-5-yl and 1,4-dioxan-2-yl.

Particular values for AR3 include, for example, bicyclic benzo-fused systems containing a 5- or 6-membered heteroaryl ring containing one nitrogen atom and optionally 1-3 further heteroatoms chosen from oxygen, sulfur and nitrogen. Specific examples of such ring systems include, for example, indole, benzofuran, benzothiophene, benzimidazole, benzothiazole, benzisothiazole, benzoxazole, benzisoxazole, quinoline, quinoxaline, quinazoline, phthalazine and cinnoline.

Other particular examples of AR3 include 5/5-, 5/6 and 6/6 bicyclic ring systems containing heteroatoms in both of the rings. Specific examples of such ring systems include, for example, purine and naphthyridine.

- 21 -

Further particular examples of AR3 include bicyclic heteroaryl ring systems with at least one bridgehead nitrogen and optionally a further 1-3 heteroatoms chosen from oxygen, sulfur and nitrogen. Specific examples of such ring systems include, for example, 3H-pyrrolo[1,2-a]pyrrole, pyrrolo[2,1-b]thiazole, 1H-imidazo[1,2-a]pyrrole,

- 5 1H-imidazo[1,2-a]imidazole, 1H,3H-pyrrolo[1,2-c]oxazole, 1H-imidazo[1,5-a]pyrrole, pyrrolo[1,2-b]isoxazole, imidazo[5,1-b]thiazole, imidazo[2,1-b]thiazole, indolizine, imidazo[1,2-a]pyridine, imidazo[1,5-a]pyridine, pyrazolo[1,5-a]pyridine, pyrrolo[1,2-b]pyridazine, pyrrolo[1,2-c]pyrimidine, pyrrolo[1,2-a]pyrazine, pyrrolo[1,2-a]pyrimidine, pyrido[2,1-c]-s-triazole, s-triazole[1,5-a]pyridine,
- 10 imidazo[1,2-c]pyrimidine, imidazo[1,2-a]pyrazine, imidazo[1,2-a]pyrimidine, imidazo[1,5-a]pyrazine, imidazo[1,5-a]pyrimidine, imidazo[1,2-b]-pyridazine, s-triazolo[4,3-a]pyrimidine, imidazo[5,1-b]oxazole and imidazo[2,1-b]oxazole. Other specific examples of such ring systems include, for example, [1H]-pyrrolo[2,1-c]oxazine, [3H]-oxazolo[3,4-a]pyridine, [6H]-pyrrolo[2,1-c]oxazine and pyrido[2,1-c][1,4]oxazine. Other
- 15 specific examples of 5/5- bicyclic ring systems are imidazooxazole or imidazothiazole, in particular imidazo[5,1-b]thiazole, imidazo[2,1-b]thiazole, imidazo[5,1-b]oxazole or imidazo[2,1-b]oxazole.

Particular examples of AR3a and AR3b include, for example, indoline, 1,3,4,6,9,9a-hexahydropyrido[2,1c][1,4]oxazin-8-yl, 1,2,3,5,8,8a-hexahydroimidazo[1,5a]pyridin-7-yl, 1,5,8,8a-tetrahydrooxazolo[3,4a]pyridin-7-yl, 1,5,6,7,8,8a-hexahydrooxazolo[3,4a]pyridin-7-yl, (7aS)[3H,5H]-1,7a-dihydropyrrolo[1,2c]oxazol-6-yl, (7aS)[5H]-1,2,3,7a-tetrahydropyrrolo[1,2c]imidazol-6-yl, (7aR)[3H,5H]-1,7a-dihydropyrrolo[1,2c]oxazol-6-yl, [3H,5H]-pyrrolo[1,2-c]oxazol-6-yl, [5H]-2,3-dihydropyrrolo[1,2-c]imidazol-6-yl, [3H,5H]-pyrrolo[1,2-c]thiazol-6-yl, [3H,5H]-1,7a-dihydropyrrolo[1,2-c]thiazol-6-yl, [5H]-pyrrolo[1,2-c]imidazol-6-yl, [1H]-3,4,8,8a-tetrahydropyrrolo[2,1-c]oxazin-7-yl, [3H]-1,5,8,8a-tetrahydrooxazolo[3,4-a]pyrid-7-yl, [3H]-5,8-dihydrooxazolo[3,4-a]pyrid-7-yl and 5,8-dihydroimidazo[1,5-a]pyrid-7-yl.

Particular values for AR4 include, for example, pyrrolo[a]quinoline,

- 30 2,3-pyrroloisoquinoline, pyrrolo[a]isoquinoline, 1H-pyrrolo[1,2-a]benzimidazole, 9H-imidazo[1,2-a]indole, 5H-imidazo[2,1-a]isoindole, 1H-imidazo[3,4-a]indole, imidazo[1,2-a]quinoline, imidazo[2,1-a]isoquinoline, imidazo[1,5-a]quinoline and imidazo[5,1-a]isoquinoline.

The nomenclature used is that found in, for example, "Heterocyclic Compounds (Systems with bridgehead nitrogen), W.L.Mosby (Interscience Publishers Inc., New York), 1961, Parts 1 and 2.

Where optional substituents are listed such substitution is preferably not geminal disubstitution unless stated otherwise. If not stated elsewhere, suitable optional substituents for a particular group are those as stated for similar groups herein.

Preferable optional substituents on Ar2b as 1,3-dioxolan-4-yl, 1,3-dioxan-4-yl, 1,3-dioxan-5-yl or 1,4-dioxan-2-yl are mono- or disubstitution by substituents independently selected from (1-4C)alkyl (including geminal disubstitution), (1-4C)alkoxy, (1-4C)alkylthio, 10 acetamido, (1-4C)alkanoyl, cyano, trifluoromethyl and phenyl].

Preferable optional substituents on CY1 & CY2 are mono- or disubstitution by substituents independently selected from (1-4C)alkyl (including geminal disubstitution), hydroxy, (1-4C)alkoxy, (1-4C)alkylthio, acetamido, (1-4C)alkanoyl, cyano, and trifluoromethyl.

15 Suitable pharmaceutically-acceptable salts include acid addition salts such as methanesulfonate, fumarate, hydrochloride, citrate, maleate, tartrate and (less preferably) hydrobromide. Also suitable are salts formed with phosphoric and sulfuric acid. In another aspect suitable salts are base salts such as an alkali metal salt for example sodium, an alkaline earth metal salt for example calcium or magnesium, an organic amine salt for example 20 triethylamine, morpholine, N-methylpiperidine, N-ethylpiperidine, procaine, dibenzylamine, N,N-dibenzylethylamine, tris-(2-hydroxyethyl)amine, N-methyl d-glucamine and amino acids such as lysine. There may be more than one cation or anion depending on the number of charged functions and the valency of the cations or anions. A preferred pharmaceutically-acceptable salt is the sodium salt.

25 However, to facilitate isolation of the salt during preparation, salts which are less soluble in the chosen solvent may be preferred whether pharmaceutically-acceptable or not.

The compounds of the formula (I) may be administered in the form of a pro-drug which is broken down in the human or animal body to give a compound of the formula (I). A prodrug may be used to alter or improve the physical and/or pharmacokinetic profile of the 30 parent compound and can be formed when the parent compound contains a suitable group or substituent which can be derivatised to form a prodrug. Examples of pro-drugs include in-vivo hydrolysable esters of a compound of the formula (I) or a pharmaceutically-acceptable salt thereof.

10 An in-vivo hydrolysable ester of a compound of the invention or a pharmaceutically-acceptable salt thereof containing a carboxy or hydroxy group is, for example, a pharmaceutically-acceptable ester which is hydrolysed in the human or animal body to produce the parent alcohol.

Suitable pharmaceutically-acceptable esters for carboxy include (1-6C)alkoxymethyl esters for example methoxymethyl, (1-6C)alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters, (3-8C)cycloalkoxycarbonyloxy(1-6C)alkyl esters for example 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolan-2-onylmethyl esters for example 5-methyl-1,3-dioxolan-2-ylmethyl; and (1-6C)alkoxycarbonyloxyethyl esters for example 1-methoxycarbonyloxyethyl and may be formed at any carboxy group in the compounds of this 20 invention.

Suitable pro-drugs for pyridine derivatives include acyloxymethyl pyridinium salts eg halides; for example a pro-drug such as:

25

An in-vivo hydrolysable ester of a compound of the invention or a pharmaceutically-acceptable salt thereof containing a hydroxy group or groups includes inorganic esters such as phosphate esters (including phosphoramidic cyclic esters) and α -acyloxyalkyl ethers and related compounds which as a result of the in-vivo hydrolysis of the ester breakdown to give

- 24 -

the parent hydroxy group/s. Examples of α -acyloxyalkyl ethers include acetoxymethoxy and 2,2-dimethylpropionyloxymethoxy. A selection of in-vivo hydrolysable ester forming groups for hydroxy include (1-10C)alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, (1-10C)alkoxycarbonyl (to give alkyl carbonate esters), di-(1-5C)alkylcarbamoyl and N-(di-(1-4C)alkylaminoethyl)-N-(1-4C)alkylcarbamoyl (to give carbamates), di-(1-4C)alkylaminoacetyl, carboxy(2-5C)alkylcarbonyl and carboxyacetyl. Examples of ring substituents on phenylacetyl and benzoyl include chloromethyl or aminomethyl, (1-4C)alkylaminomethyl and di-((1-4C)alkyl)aminomethyl, and morpholino or piperazino linked from a ring nitrogen atom via a methylene linking group to the 3- or 4- position of the benzoyl ring. Other interesting in-vivo hydrolysable esters include, for example, $R^A C(O)O(1-6C)alkyl-CO-$ (wherein R^A is for example, optionally substituted benzyloxy-(1-4C)alkyl, or optionally substituted phenyl; suitable substituents on a phenyl group in such esters include, for example, 4-(1-4C)piperazino-(1-4C)alkyl, piperazino-(1-4C)alkyl and morpholino-(1-4C)alkyl.

15 Suitable in-vivo hydrolysable esters of a compound of the formula (I) are described as follows. For example, a 1,2-diol may be cyclised to form a cyclic ester of formula (PD1) or a pyrophosphate of formula (PD2), and a 1,3-diol may be cyclised to form a cyclic ester of the formula (PD3):

20

(PD1)

(PD2)

(PD3)

Esters of compounds of formula (I) wherein the HO- function/s in (PD1), (PD2) and (PD3) are protected by (1-4C)alkyl, phenyl or benzyl are useful intermediates for the preparation of such pro-drugs.

Further in-vivo hydrolysable esters include phosphoramidic esters, and also 25 compounds of invention in which any free hydroxy group independently forms a phosphoryl (npd is 1) or phosphiryl (npd is 0) ester of the formula (PD4) :

For the avoidance of doubt, phosphono is $-\text{P}(\text{O})(\text{OH})_2$; (1-4C)alkoxy(hydroxy)-phosphoryl is a mono-(1-4C)alkoxy derivative of $-\text{O}-\text{P}(\text{O})(\text{OH})_2$; and

5 di-(1-4C)alkoxyphosphoryl is a di-(1-4C)alkoxy derivative of $-\text{O}-\text{P}(\text{O})(\text{OH})_2$.

Useful intermediates for the preparation of such esters include compounds containing a group/s of formula (PD4) in which either or both of the -OH groups in (PD1) is independently protected by (1-4C)alkyl (such compounds also being interesting compounds in their own right), phenyl or phenyl-(1-4C)alkyl (such phenyl groups being optionally

10 substituted by 1 or 2 groups independently selected from (1-4C)alkyl, nitro, halo and (1-4C)alkoxy).

Thus, prodrugs containing groups such as (PD1), (PD2), (PD3) and (PD4) may be prepared by reaction of a compound of invention containing suitable hydroxy group/s with a suitably protected phosphorylating agent (for example, containing a chloro or dialkylamino

15 leaving group), followed by oxidation (if necessary) and deprotection.

Other suitable prodrugs include phosphonooxymethyl ethers and their salts, for example a prodrug of R-OH such as:

20

When a compound of invention contains a number of free hydroxy group, those groups not being converted into a prodrug functionality may be protected (for example, using a t-butyl-dimethylsilyl group), and later deprotected. Also, enzymatic methods may be used to selectively phosphorylate or dephosphorylate alcohol functionalities.

25 Where pharmaceutically-acceptable salts of an in-vivo hydrolysable ester may be formed this is achieved by conventional techniques. Thus, for example, compounds containing a group of formula (PD1), (PD2), (PD3) and/or (PD4) may ionise (partially or fully) to form salts with an appropriate number of counter-ions. Thus, by way of example, if an in-vivo hydrolysable ester prodrug of a compound of invention contains two (PD4) groups,

30 there are four HO-P- functionalities present in the overall molecule, each of which may form

- 26 -

an appropriate salt (i.e. the overall molecule may form, for example, a mono-, di-, tri- or tetra-sodium salt).

The compounds of the present invention have a chiral centre at the C-5 position of the oxazolidinone ring. The pharmaceutically active enantiomer is of the formula (IA):

5

10

(IA)

The present invention includes the pure enantiomer depicted above or mixtures of the 5R and 5S enantiomers, for example a racemic mixture. If a mixture of enantiomers is used, a larger amount (depending upon the ratio of the enantiomers) will be required to achieve the same effect as the same weight of the pharmaceutically active enantiomer. The enantiomer 15 depicted above may be the 5(R) or 5(S) enantiomer depending on the nature of the N-HET group (for example, when -N-HET is imidazole it is the 5(S) enantiomer).

Furthermore, some compounds of the formula (I) may have other chiral centres, for example, certain sulfoxide compounds may be chiral at the sulfur atom. It is to be understood that the invention encompasses all such optical and diastereo-isomers, and racemic mixtures, 20 that possess antibacterial activity. It is well known in the art how to prepare optically-active forms (for example by resolution of the racemic form by recrystallisation techniques, by chiral synthesis, by enzymatic resolution, by biotransformation or by chromatographic separation) and how to determine antibacterial activity as described hereinafter.

Furthermore, some compounds of the formula (I), for example certain sulfoxide 25 compounds may exist as cis- and trans- isomers. It is to be understood that the invention encompasses all such isomers, and mixtures thereof, that possess antibacterial activity.

The invention relates to all tautomeric forms of the compounds of the formula (I) that possess antibacterial activity.

It is also to be understood that certain compounds of the formula (I) can exist in 30 solvated as well as unsolvated forms such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms which possess antibacterial activity.

It is also to be understood that certain compounds of the formula (I) may exhibit polymorphism, and that the invention encompasses all such forms which possess antibacterial activity.

As stated before, we have discovered a range of compounds that have good activity
5 against a broad range of Gram-positive pathogens, including organisms known to be resistant to most commonly used antibiotics, and to certain fastidious Gram negative strains such as *H.influenzae* and *M.catarrhalis*. They have good physical and/or pharmacokinetic properties in general, and favourable toxicological and MAO profiles.

Particularly preferred compounds of the invention comprise a compound of formula
10 (I), or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof, wherein the substituents Q, HET (which may also be described as -N-HET herein), T and other substituents mentioned above have values disclosed hereinbefore, or any of the following values (which may be used where appropriate with any of the definitions and embodiments disclosed hereinbefore or hereinafter):

15 In one embodiment of the invention are provided compounds of formula (I), in an alternative embodiment are provided pharmaceutically-acceptable salts of compounds of formula (I), in a further alternative embodiment are provided in-vivo hydrolysable esters of compounds of formula (I), and in a further alternative embodiment are provided pharmaceutically-acceptable salts of in-vivo hydrolysable esters of compounds of formula (I).

20 In another embodiment of the invention are provided compounds of formula (I), or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof, in which Q, HET (which may also be described as -N-HET herein) and other substituents mentioned above have the values disclosed hereinbefore, and T is as defined hereinbefore and hereinafter for (TA), (TB) and (TD) (i.e. in this embodiment T is not (TC) or (TE)).

25 In another embodiment of the invention are provided compounds of formula (I), or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof, in which Q, HET (which may also be described as -N-HET herein) and other substituents mentioned above have the values disclosed hereinbefore, and T is as defined hereinbefore and hereinafter for (TC), particularly TC4.

30 In another embodiment of the invention are provided compounds of formula (I), or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof, in which Q, HET (which may also be described as -N-HET herein) and other substituents mentioned above have the values disclosed hereinbefore, and T is as defined hereinbefore and hereinafter for

(TA).

In another embodiment of the invention are provided compounds of formula (I), or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof, in which Q, HET (which may also be described as -N-HET herein) and other substituents mentioned above 5 have the values disclosed hereinbefore, and T is as defined hereinbefore and hereinafter for (TA) and (TC).

In a further embodiment of the invention are provided compounds of formula (I), or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof, in which Q, HET (which may also be described as -N-HET herein), T and other substituents mentioned above 10 have the values disclosed hereinbefore and R1 is selected from the group (R1b).

Preferably Q is selected from Q1, Q2, Q4 and Q6; especially Q1 and Q2; and most preferably Q is Q1.

In one embodiment R1 has values (R1a) to (R1c1).

Preferable R1 groups are those of (R1a) and (R1b).

15 In (R1b) the substituted (1-4C)alkyl group is preferably a substituted methyl group.

Preferable (R1) groups provided by optional F and/or Cl and/or one cyano further substituents in (R1a) and (R1b) are, for example, R1 as trifluoromethyl, -CHF₂, -CH₂F, -CH₂CN, -CF₂NH(1-4C)alkyl, -CF₂CH₂OH, -CH₂OCF₃, -CH₂OCHF₂, -CH₂OCH₂F, -NHCF₂CH₃.

20 In one aspect R1 is preferably selected from a substituent from the groups R1a, R1b and R1d wherein:

(R1a) halogen, hydroxy, (1-4C)alkoxy, (2-4C)alkenyloxy, (2-4C)alkenyl, (2-4C)alkynyl (optionally substituted on the terminal carbon by CH₂=CH-, di(1-4C)alkylamino, AR2, AR2a or AR2b), (3-6C)cycloalkyl, (3-6C)cycloalkenyl, 25 (1-4C)alkyl-S(O)q- (wherein q is 0), amino, (1-4C)alkylcarbonylamino, (1-4C)alkylamino, di-(1-4C)alkylamino and (2-4C)alkenylamino;

(R1b) a (1-4C)alkyl group which is substituted by one substituent selected from hydroxy, halo, (1-4C)alkoxy, amino, (1-4C)alkylamino, di-(1-4C)alkylamino, (1-4C)alkyl-S(O)q- (wherein q is 0, 1 or 2), cyano and azido, (3-6C)cycloalkyl, AR1-S(O)q- (wherein q is 0, 1 or 2 and AR1 is defined hereinbelow), AR2-S(O)q- (wherein q is 0, 1 or 2), AR2a-S(O)q- (wherein q is 0, 1 or 2), benzyl-S(O)q- (wherein q is 0, 1 or 2), (1-4C)alkyl-OCO-NH-, (1-4C)alkyl-NHCO-O-, (1-4C)alkylaminocarbonyl, 30 di(1-4C)alkylaminocarbonyl and H₂NC(=NH)S-;

- 29 -

(R1d) cyano, nitro, azido, formyl, (1-4C)alkylcarbonyl, (1-4C)alkoxycarbonyl, $\text{H}_2\text{NC(O)-}$, $((1-4\text{C})\text{alkyl})\text{NHC(O)-};$; and wherein at each occurrence of an R1 substituent containing an alkyl, alkenyl, alkynyl, cycloalkyl or cycloalkenyl moiety in (R1a) or (R1b) each such moiety is optionally further 5 substituted on an available carbon atom with one, two, three or more substituents independently selected from F, Cl, Br, OH and CN.

In another aspect R1 is preferably selected from a substituent from the groups R1a, R1b and R1d, wherein:

- (R1a) halogen, hydroxy, (1-4C)alkoxy, (2-4C)alkenyl, (2-4C)alkynyl, 10 -ethynyl-ethene, -ethynyl-AR2, -ethynyl-AR2a, -but-2-ynyl-4-AR2a, -but-2-ynyl-4-AR2b, -but-2-ynyl-4-di(1-4C)alkylamino, (3-6C)cycloalkyl, (1-4C)alkyl-S(O)q- (wherein q is 0), (1-4C)alkylcarbonylamino and amino,
- (R1b) a (1-4C)alkyl group which is substituted by one substituent selected from hydroxy, halo, (1-4C)alkoxy, amino, di(1-4C)alkylamino, cyano, azido, (1-4C)alkyl-S(O)q- 15 (wherein q is 0, 1 or 2), AR2-S(O)q- (wherein q is 0), benzyl-S(O)q- (wherein q is 0), (1-4C)alkyl-OCO-NH-, (1-4C)alkyl-NHCO-O-, di(1-4C)alkylaminocarbonyl and $\text{H}_2\text{NC(=NH)S-};$
- (R1d) cyano, nitro, formyl, (1-4C)alkoxycarbonyl and $\text{H}_2\text{NC(O)-};$ and wherein at each occurrence of an R1 substituent containing an alkyl, alkenyl, alkynyl, 20 cycloalkyl or cycloalkenyl moiety in (R1a) or (R1b) each such moiety is optionally further substituted on an available carbon atom with one, two or three substituents independently selected from F, Cl, Br, OH and CN.

When R1a is -ethynyl-AR2, conveniently AR2 is a 5-membered ring, particularly AR2 is oxazolyl, isoxazolyl, thiazolyl or thiadiazolyl.

- 25 When R1a is -ethynyl-AR2a or -but-2-ynyl-4-AR2a, conveniently AR2a is a 5 membered ring, particularly AR2a as 3-pyrroline, 2H-pyrrole or pyrazoline.

When R1a is -but-2-ynyl-4-AR2b, conveniently AR2b a 6-membered ring such as morpholine.

In a further aspect R1 is most preferably

- 30 (a) hydrogen; or
- (b) halogen, in particular fluorine, chlorine, or bromine; or
- (c) cyano; or

- 30 -

- (d) monosubstituted (1-4C)alkyl, in particular fluoromethyl, chloromethyl, bromomethyl, cyanomethyl, azidomethyl, hydroxymethyl; or
- (e) disubstituted (1-4C)alkyl, for example difluoromethyl, or
- (f) trisubstituted (1-4C)alkyl, for example trifluoromethyl; or
- 5 (g) ethynyl or substituted ethynyl; or
- (h) nitro

In (TAb), preferred are (TAb1) to (TAb5), and especially (TAb2), (TAb3) and/or (TAb5), most especially (TAb2) and (TAb5). The above preferred values of (TAb) are
10 particularly preferred when present in Q1 or Q2, especially Q1.

In (TAb) it is to be understood that when a value for $-X^1-$ is a two-atom link and is written, for example, as $-\text{CH}_2\text{NH}-$ it is the left hand part ($-\text{CH}_2-$ here) which is bonded to the group of formula (TAb1) to (TAb6) and the right hand part ($-\text{NH}-$ here) which is bonded to $-Y^1-$ in the definition in (TAbc). Similarly, when $-Y^1-$ is a two-atom link and is written, for
15 example, as $-\text{CONH}-$ it is the left hand part of $-Y^1-$ ($-\text{CO}-$ here) which is bonded to the right hand part of $-X^1-$, and the right hand part of $-Y^1-$ ($-\text{NH}-$ here) which is bonded to the AR2, AR2a, AR2b, AR3, AR3a or AR3b moiety in the definition in (TAbc).

In one embodiment, in (TAb) preferably R^6 is hydrogen or (1-4C)alkyl, and R^4 and R^5 are independently selected from hydrogen, cyano, formyl, bromo, hydroxymethyl, thiomethyl,
20 (1-4C)alkyl (particularly methyl) and hydroxyimino or one of R^4 and R^5 is selected from group (TAb1). Most preferable is (TAb2) and/or (TAb5) with such preferable substituents.

In another embodiment in (TAb) preferably R^6 is hydrogen or (1-4C)alkyl, and R^4 and R^5 are independently selected from hydrogen, cyano, formyl, bromo, hydroxymethyl, (1-4C)alkyl or one of R^4 and R^5 is selected from group (TAb1). Most preferable is (TAb2)
25 and/or (TAb5) with such preferable substituents.

In another embodiment, in (TAb) preferably R^6 is hydrogen or (1-4C)alkyl, and R^4 and R^5 are independently selected from hydrogen, cyano, formyl, bromo, hydroxymethyl, thiomethyl, (1-4C)alkyl (particularly methyl) and hydroxyimino. Most preferable is (TAb2) and/or (TAb5) with such preferable substituents.

30 In another embodiment, in (TAb), R^6 is hydrogen and R^4 and R^5 are independently selected from hydrogen and methyl.

In (TC), for the avoidance of doubt, $()_{m1}$, $()_{n1}$ and $()_{o1}$ indicate $(-\text{CH}_2-)_{m1}$, $(-\text{CH}_2-)_{n1}$ and $(-\text{CH}_2-)_{o1}$ respectively (optionally substituted as described above).

- 31 -

In the definition of (TC1) to (TC4), in an alternative embodiment $>A_3-B_3-$ is not $>N-CH_2-$ in (TC1) to (TC3).

In the above definition of (TC1) to (TC4) and of the further optional substituents :-

(i) ARc is preferably AR2, and in one embodiment the further optional substituents are
5 preferably not selected from the values listed for Rc.

(ii) A preferred value for G is $>N(Rc)$ or $>C(R^{11})(R^{12})$. Also preferred is G as O or S, particularly in (TC4) when Rp is hydrogen.

(iii) Preferred is (TC4) as piperazinyl, morpholino or thiomorpholino or as tetrahydropyridin-4-yl.

10 (iv) $>A_3-B_3-$ is preferably $>C(Rq)-CH(Rr)-$ in (TC1) to (TC3).

Particularly preferred values for the optional substituents and groups defined in (TC) are rings of formula (TC5) to (TC11), particularly when present in Q1 or Q2, especially Q1 :-

(TC5)

(TC6)

(TC7)

15

(TC8)

(TC9)

(TC10)

(TC11)

wherein Rc has any of the values listed hereinbefore or hereinafter.

20 Especially preferred are (TC5), (TC6), (TC7) and (TC9), most especially (TC5) in which Rc has any of the values listed hereinbefore or hereinafter (especially $R^{13}CO-$ with the preferable R^{13} values given hereinafter). In (TC5) Rc is preferably selected from the group (Rc2), especially $R^{13}CO-$ with the preferable R^{13} values given hereinafter. In (TC7) Rc is preferably selected from group (Rc3) or (Rc4).

25 For (TC), further preferred values for the optional substituents and groups defined in (TC) are rings of formula (TC12) and (TC13), particularly when present in Q1 or Q2, especially Q1 :-

- 32 -

(TC12)

(TC13)

wherein G is -O-, -S-, -SO-, -SO₂- or >N(Rc) and Rc, o1 and n1 have any of the values defined herein.

5 Preferably (TC12) is (TC12a), (TC12b), (TC12c) or (TC12d) and preferably (TC13) is (TC13a), particularly when present in Q1 or Q2, especially Q1 :-

(TC12a)

(TC12b)

(TC13a)

(TC12c)

(TC12d)

10

wherein m is 0, 1 or 2.

In (TDb), particularly preferred values are when present in Q1 or Q2, especially Q1.

15 In (TDb) it will be appreciated that unstable anti-Bredt compounds are not contemplated in this definition (i.e. compounds with structures (TDb3), (TDb4), (TDb7), (TDb8), (TDb9), (TDb12), (TDb13) and (TDb14) in which an sp² carbon atom is directed towards a bridgehead position).

20 In (TDb), particularly preferred values of (TDb) are the following structures of formula (TDb4), (TDb8) and/or (TDb9); wherein Rc has any of the values listed hereinbefore or hereinafter. The values of (TDb) are particularly preferred when present in Q1 or Q2, especially Q1.

[2,2,1]
(TDb4a & b)[3,2,1]
(TDb8)[2,2,2]
(TDb9)

In (TE1) to (TE3), preferred values for the groups defined in (TE) are defined by formulae (TE1a, b), (TE2a) and (TE3a), particularly when present in Q1 or Q2, especially Q1:

5

(TE1a)

(TE1b)

(TE2a)

(TE3a)

10 wherein G is -O-, -S-, -SO- or -SO₂-.

Preferably (T) is (TC12a), (TC12b) or (TAb2) particularly when present in Q1 or Q2, especially Q1.

Preferable values for other substituents (which may be used where appropriate with any of the definitions and embodiments disclosed hereinbefore or hereinafter) are :-

- 15 (a) -N-HET is preferably of formula (Ic), (Id) or (If).
- (b) In one aspect preferably one of R² and R³ is hydrogen and the other fluoro. In another aspect both R² and R³ are fluoro.
- (c) In another aspect one of R² and R³ is hydrogen or fluoro and the other is selected from Cl, CF₃, Me, Et, OMe and SMe.
- 20 (d) In (TC4) preferably >A₃-B₃- is >C=CH- or >N-CH₂-.
- (e) Preferably R_c is R¹³CO- and preferably R¹³ is (1-4C)alkoxycarbonyl, hydroxy(1-4C)alkyl, (1-4C)alkyl (optionally substituted by one or two hydroxy groups, or by an (1-4C)alkanoyl group), (1-4C)alkylamino, dimethylamino(1-4C)alkyl, (1-4C)alkoxymethyl, (1-4C)alkanoylmethyl, (1-4C)alkanoyloxy(1-4C)alkyl, (1-5C)alkoxy or 2-cyanoethyl.
- 25 (f) More preferably R¹³ is 1,2-dihydroxyethyl, 1,3-dihydroxyprop-2-yl, 1,2,3-trihydroxyprop-1-yl, methoxycarbonyl, hydroxymethyl, methyl, methylamino, dimethylaminomethyl, methoxymethyl, acetoxyethyl, methoxy, methylthio, naphthyl, tert-butoxy or 2-cyanoethyl.

- 34 -

- (g) Particularly preferred as R¹³ is 1,2-dihydroxyethyl, 1,3-dihydroxyprop-2-yl or 1,2,3-trihydroxyprop-1-yl.
- (h) In another aspect preferably R¹³ is (1-10C)alkyl [optionally substituted by one or more hydroxy] or R¹⁴C(O)O(1-6C)alkyl.

5 For compounds of formula (I) preferred values for Rc are those in group (Rc2) when present in any of the definitions herein containing Rc - for example when present in compounds in which there is a (TC5) or (TC9) ring system.

In the definition of (Rc2c) the AR2a, AR2b, AR3a and AR3b versions of AR2 and AR3 containing groups are preferably excluded.

10 Where the number of optional substituents on a group is not otherwise preferably defined, the preferable number of optional substituents is one.

Particularly preferred compounds of the present invention are of the formula (IB):

15

(IB)

wherein -N-HET is 1,2,3-triazol-1-yl or tetrazol-2-yl;

20 R1 is selected from (R1a) or (R1b);

R² and R³ are independently hydrogen or fluoro; and

T is selected from (TAb1 to 6), (TC5), (TC7), (TC9), (TC12), (TC13) and (TE1) to (TE3); or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

Further particularly preferred compounds of the present invention are of the formula

25 (IB) defined above, wherein -N-HET is 1,2,3-triazol-1-yl or tetrazol-2-yl;

R1 is selected from (R1d);

R² and R³ are independently hydrogen or fluoro; and

T is selected from (TAb1 to 6), (TC5), (TC7), (TC9), (TC12), (TC13) and (TE1) to (TE3); or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

30 Further particularly preferred compounds of the present invention are of the formula

(IB) defined above, wherein -N-HET is 1,2,3-triazol-1-yl or tetrazol-2-yl;

R1 is selected from (R1a), (R1b) and (R1d);

R² and R³ are independently hydrogen or fluoro; and

- 35 -

T is selected from (TAb1 to 6), (TC12a) and (TC12b) ; or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

Further particularly preferred compounds of the present invention are of the formula (IB) defined above, wherein -N-HET is 1,2,3-triazol-1-yl or tetrazol-2-yl;

5 R1 is selected from (R1a), (R1b) and (R1d);

R² and R³ are independently hydrogen or fluoro; and

T is selected from (TAb2), (TAb3), (TAb5), (TAb6), (TC5), (TC12a), (TC12b), (TC12d) and (TC13a); or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

Further particularly preferred compounds of the present invention are of the formula 10 (IB) defined above, wherein -N-HET is 1,2,3-triazol-1-yl or tetrazol-2-yl;

R1 is selected from (R1a), (R1b) and (R1d);

R² and R³ are independently hydrogen or fluoro; and

T is selected from (TAb2), (TC12a) and (TC12b) ; or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

15 Further particularly preferred compounds of the present invention are of the formula (IB) defined above wherein R1 is a methyl group from (R1b), substituted with any of those substituents defined herein in (R1b), or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

Further especially preferred compounds of the invention are of the formula (IB) 20 defined above wherein T is selected from (TAb2 & 5), (TC5), (TC9), (TC12a to d), (TC13a), (TE1a & b), (TE2a) and (TE3a); or in-vivo hydrolysable esters or pharmaceutically-acceptable salts thereof.

In the above aspects and preferred compounds of formula (IB), in (TC5), (TC7), (TC9), preferably Rc is as defined in (Rc2) and especially R¹³CO- wherein R¹³ is preferably 25 (1-4C)alkoxycarbonyl, hydroxy(1-4C)alkyl, (1-4C)alkyl (optionally substituted by one or two hydroxy groups, or by an (1-4C)alkanoyl group), (1-4C)alkylamino, dimethylamino(1-4C)alkyl, (1-4C)alkoxymethyl, (1-4C)alkanoylmethyl, (1-4C)alkanoyloxy(1-4C)alkyl, (1-5C)alkoxy or 2-cyanoethyl.

In all of the above aspects and preferred compounds of formula (IB), in-vivo 30 hydrolysable esters are preferred where appropriate, especially phosphoryl esters (as defined by formula (PD4) with npd as 1).

In all of the above definitions the preferred compounds are as shown in formula (IA), i.e. the pharmaceutically active enantiomer.

Process section :

In a further aspect the present invention provides a process for preparing a compound of formula (I) or a pharmaceutically-acceptable salt or an in-vivo hydrolysable ester thereof.

5 It will be appreciated that during certain of the following processes certain substituents may require protection to prevent their undesired reaction. The skilled chemist will appreciate when such protection is required, and how such protecting groups may be put in place, and later removed.

For examples of protecting groups see one of the many general texts on the subject, 10 for example, 'Protective Groups in Organic Synthesis' by Theodora Green (publisher: John Wiley & Sons). Protecting groups may be removed by any convenient method as described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with minimum disturbance of groups elsewhere in the molecule.

15 Thus, if reactants include, for example, groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxycarbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or *t*-butoxycarbonyl group, an arylmethoxycarbonyl group, 20 for example benzyloxycarbonyl, or an aroyl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxycarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such 25 as a *t*-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulfuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group 30 for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an

- 37 -

arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide.

5 Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a *t*-butyl group which may be removed, 10 for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

Resins may also be used as a protecting group.

The protecting groups may be removed at any convenient stage in the synthesis using 15 conventional techniques well known in the chemical art.

A compound of the formula (I), or a pharmaceutically-acceptable salt or an *in vivo* hydrolysable ester thereof, may be prepared by any process known to be applicable to the preparation of chemically-related compounds. Such processes, when used to prepare a compound of the formula (I), or a pharmaceutically-acceptable salt or an *in vivo* hydrolysable 20 ester thereof, are provided as a further feature of the invention and are illustrated by the following representative examples. Necessary starting materials may be obtained by standard procedures of organic chemistry (see, for example, Advanced Organic Chemistry (Wiley-Interscience), Jerry March). The preparation of such starting materials is described within the accompanying non-limiting Examples (in which, for example, 3,5-difluorophenyl, 3-fluorophenyl and (des-fluoro)phenyl containing intermediates may all be prepared by 25 analogous procedures; or by alternative procedures - for example, the preparation of (T group)-(fluoro)phenyl intermediates by reaction of a (fluoro)phenylstannane with, for example, a pyran or (tetrahydro)pyridine compound, may also be prepared by anion chemistry (see, for example, WO97/30995). Alternatively, necessary starting materials are obtainable by 30 analogous procedures to those illustrated which are within the ordinary skill of an organic chemist. Information on the preparation of necessary starting materials or related compounds (which may be adapted to form necessary starting materials) may also be found in the

Process section :

Thus, the present invention also provides that the compounds of the formula (I) and
30 pharmaceutically-acceptable salts and *in vivo* hydrolysable esters thereof, can be prepared by a process (a) to (h) as follows (wherein the variables are as defined above unless otherwise stated) :

- 39 -

(a) by modifying a substituent in, or introducing a new substituent into, the substituent group R1 of HET of another compound of formula (I) - for instance by (i) displacement of a functional group from a compound of formula (I) by another functional group, (ii) by oxidation or (iii) reduction of a compound of formula (I), by (iv) addition of a reagent to or 5 (v) elimination of a reagent from a compound of formula (I), by (vi) metathesis of a compound of formula (I) into a modified compound of formula (I), or by (vii) rearrangement of a compound of formula (I) to an isomeric compound of formula (I); or by modifying a substituent in, or introducing a new substituent into, the group Q of another compound of formula (I) - for instance by (i) displacement of a functional group from a compound of 10 formula (I) by another functional group, (ii) by oxidation or (iii) reduction of a compound of formula (I), by (iv) addition of a reagent to or (v) elimination of a reagent from a compound of formula (I), by (vi) metathesis of a compound of formula (I) into a modified compound of formula (I), or by (vii) rearrangement of a compound of formula (I) to an isomeric compound of formula (I) (Scheme I shows examples drawn from the range of suitable methods); or 15 (b) by reaction of a compound of formula (II) :

(II)

wherein Y is a displaceable group (which may be preformed, such as chloro or mesylate, or generated in-situ, for example under Mitsunobu conditions) with a compound of the formula 20 (III) :

HET

(III)

wherein HET (of formula (Ia) to (If), already substituted and optionally protected) is HET-H 25 free-base form or HET- anion formed from the free base form (Scheme II shows examples drawn from the range of suitable methods); or

(c) by reaction of a compound of the formula (IV) :

Q-Z

(IV)

- 40 -

wherein Z is an isocyanate, amine or urethane group with an epoxide of the formula (V) wherein the epoxide group serves as a leaving group at the terminal C-atom and as a protected hydroxy group at the internal C-atom; or with a related compound of formula (VI) where the hydroxy group at the internal C-atom is conventionally protected e.g. with an acetyl group and where the leaving group Y at the terminal C-atom is a conventional leaving group e.g. a chloro- or mesyloxy-group;

(Scheme III shows examples drawn from the range of suitable methods), or

10 (d) (i) by coupling, using catalysis by transition metals such as palladium(0), of a compound of formula (VII) :

wherein Y' is a group HET as hereinbefore defined, X is a replaceable substituent - such as
 15 chloride, bromide, iodide, or trifluoromethylsulfonyloxy;
 with a compound of the formula (VIII), or an analogue thereof, which is suitable to give a T
 substituent as defined by (TA) -(TE), in which the link is via an sp^2 carbon atom (D = CH=C-
 Lg where Lg is a leaving group such as chloride, bromide, iodide, or
 trifluoromethylsulfonyloxy; or as in the case of reactions carried out under Heck reaction
 20 conditions Lg may also be hydrogen) or in which the link is via an N atom (D = NH)

where T_1 and T_2 may be the same or different or may together with D form a ring of type T as hereinbefore described (Scheme IV shows examples drawn from the range of suitable 25 methods);

- 41 -

(d) (ii) by coupling, using catalysis by transition metals such as palladium(0), of a compound of formula (VIIA):

(VIIA)

5 wherein Y' is a group HET as hereinbefore defined, with a compound [Aryl]-X, where X is a replaceable substituent - such as chloride, bromide, iodide, or trifluoromethylsulfonyloxy, or an analogue thereof (Scheme IV shows an example drawn from the range of suitable methods);

(e) Where N-HET is 1,2,3-triazole there is the additional possibility by cycloaddition via 10 the azide (wherein Y in (II) is azide), with a substituted acetylene or a masked acetylene (such as a vinyl sulfone, a nitroloefin, or an enamine, or a substituted cyclohexa-1,4-diene derivative (Scheme II shows examples drawn from the range of suitable methods);

(f) Where N-HET is 1,2,3-triazole there is the additional possibility of synthesis by reaction of a compound of formula (II) where Y = NH₂ (primary amine) with a compound of 15 formula (IX), namely the arenesulfonylhydrazone of a methyl ketone that is further geminally substituted on the methyl group by two substituents (Y' and Y'') capable of being eliminated from this initial, and the intermediate, substituted hydrazones as HY' and HY'' (or as conjugate bases thereof) (Scheme V shows an example drawn from the range of suitable methods);

20

(II : Y = NH₂)

(IX)

(g) where N-HET is 1,2,3-triazole there is the additional possibility of regioselective synthesis by cycloaddition via the azide (wherein Y in (II) is azide) with a terminal alkyne 25 using Cu(I) catalysis in e.g. aqueous alcoholic solution at ambient temperatures to give 4-substituted 1,2,3-triazoles;

- 42 -

(II : Y = N₃)

(XIII)

(h) where N-HET is 1,2,3-triazole there is the additional possibility of regioselective synthesis by cycloaddition via the azide (wherein Y in (II) is azide) with an alpha-5 halovinylsulfonylchloride (XIII); and thereafter if necessary: (i) removing any protecting groups; (ii) forming a pharmaceutically-acceptable salt; (iii) forming an in-vivo hydrolysable ester.

The main synthetic routes are illustrated in Schemes (I) to (VII) below (with Q as phenyl, and T, R1, R2, R3, and A defined with reference to analogous substituents defined 10 elsewhere herein). The compounds of the invention may be prepared by analogous chemistry adapted from these Schemes. Schemes (II), (VI), and (VII) also show the preparation of 1,2,3-triazoles via the azide (prepared from the relevant hydroxy compound) and the amine (prepared e.g. from the azide) respectively.

Deprotection, salt formation or in-vivo hydrolysable ester formation may each be provided as a specific final process step.

5 The N-linked heterocycle can of course be prepared early in the overall synthesis, and then other functional groups changed.

Where Y is a displaceable group, suitable values for Y are for example, a halogeno or sulfonyloxy group, for example a chloro, bromo, methanesulfonyloxy or toluene-4-sulfonyloxy group.

10 General guidance on reaction conditions and reagents may be obtained in Advanced Organic Chemistry, 4th Edition, Jerry March (publisher : J.Wiley & Sons), 1992. Necessary starting materials may be obtained by standard procedures of organic chemistry, such as described in this process section, in the Examples section or by analogous procedures within the ordinary skill of an organic chemist. Certain references are also provided which describe 15 the preparation of certain suitable starting materials, for example International Patent Application Publication No. WO 97/37980, the contents of which are incorporated here by reference. Processes analogous to those described in the references may also be used by the ordinary organic chemist to obtain necessary starting materials.

(a) Methods for converting substituents into other substituents are known in the art. For 20 example an alkylthio group may be oxidised to an alkylsulfinyl or alkysulfonyl group, a cyano group reduced to an amino group, a nitro group reduced to an amino group, a hydroxy group alkylated to a methoxy group, a hydroxy group thiomethylated to an arylthiomethyl or a heteroarylthiomethyl group (see, for example, *Tet.Lett.*, 585, 1972), a carbonyl group converted to a thiocarbonyl group (eg. using Lawsson's reagent) or a bromo group converted 25 to an alkylthio group. It is also possible to convert one Rc group into another Rc group as a final step in the preparation of a compound of the formula (I), for example, acylation of a group of formula (TC5) wherein Rc is hydrogen.

(b)(i) Reaction (b)(i) (in which Y is initially hydroxy) is performed under Mitsunobu conditions, for example, in the presence of tri-n-butylphosphine and diethyl azodicarboxylate 30 (DEAD) in an organic solvent such as THF, and in the temperature range 0°C - 60°C, but

- 48 -

preferably at ambient temperature. Details of Mitsunobu reactions are contained in *Tet. Letts.*, 31, 699, (1990); *The Mitsunobu Reaction*, D.L.Hughes, *Organic Reactions*, 1992, Vol.42, 335-656 and *Progress in the Mitsunobu Reaction*, D.L.Hughes, *Organic Preparations and Procedures International*, 1996, Vol.28, 127-164.

5 Compounds of the formula (II) wherein Y is hydroxy may be obtained as described in the references cited herein (particularly in the section proceeding the discussion of protecting groups), for example, by reacting a compound of the formula (X) with a compound of formula (XI):

10

(X)

(XI)

15 wherein R²¹ is (1-6C)alkyl or benzyl and R²² is (1-4C)alkyl or -S(O)_n(1-4C)alkyl where n is 0, 1 or 2. Preferably R²² is (1-4C)alkyl.

In particular, compounds of the formula (II), (X) and (XI) may be prepared by the skilled man, for example as described in International Patent Application Publication Nos. WO95/07271, WO97/27188, WO 97/30995, WO 98/01446 and WO 98/01447, the contents 20 of which are hereby incorporated by reference, and by analogous processes.

If not commercially available, compounds of the formula (III) may be prepared by procedures which are selected from standard chemical techniques, techniques which are analogous to the synthesis of known, structurally similar compounds, or techniques which are analogous to the procedures described in the Examples. For example, standard chemical 25 techniques are as described in *Houben Weyl, Methoden der Organische Chemie*, E8a, Pt.I (1993), 45-225, B.J.Wakefield.

(b)(ii) Reactions (b)(ii) are performed conveniently in the presence of a suitable base such as, for example, an alkali or alkaline earth metal carbonate, alkoxide or hydroxide, for example sodium carbonate or potassium carbonate, or, for example, an organic amine base such as, for

- 49 -

example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, morpholine or diazabicyclo-[5.4.0]undec-7-ene, the reaction is also preferably carried out in a suitable inert solvent or diluent, for example methylene chloride, acetonitrile, tetrahydrofuran, 1,2-dimethoxyethane, *N,N*-dimethylformamide, *N,N*-dimethylacetamide, *N*-methylpyrrolidin-5 2-one or dimethylsulfoxide at and at a temperature in the range 25-60°C.

When Y is chloro, the compound of the formula (II) may be formed by reacting a compound of the formula (II) wherein Y is hydroxy (hydroxy compound) with a chlorinating agent. For example, by reacting the hydroxy compound with thionyl chloride, in a temperature range of ambient temperature to reflux, optionally in a chlorinated solvent such 10 as dichloromethane or by reacting the hydroxy compound with carbon tetrachloride/triphenyl phosphine in dichloromethane, in a temperature range of 0°C to ambient temperature. A compound of the formula (II) wherein Y is chloro or iodo may also be prepared from a compound of the formula (II) wherein Y is mesylate or tosylate, by reacting the latter compound with lithium chloride or lithium iodide and crown ether, in a suitable organic 15 solvent such as THF, in a temperature range of ambient temperature to reflux

When Y is (1-4C)alkanesulfonyloxy or tosylate the compound (II) may be prepared by reacting the hydroxy compound with (1-4C)alkanesulfonyl chloride or tosyl chloride in the presence of a mild base such as triethylamine or pyridine.

When Y is a phosphoryl ester (such as $(PhO)_2-P(O)-O-$ or $Ph_2-P(O)-O-$ the 20 compound (II) may be prepared from the hydroxy compound under standard conditions. (c) Reaction (c) is performed under conditions analogous to those described in the following references which disclose how suitable and analogous starting materials may be obtained.

Reaction (c) is especially suitable for compounds in which HET-H is a weakly acidic 25 heterocycle (such as, for example, triazole or tetrazole).

Compounds of the formula Q-Z wherein Z is an isocyanate may be prepared by the skilled chemist, for example by analogous processes to those described in Walter A. Gregory et al in J. Med. Chem. 1990, 33, 2569-2578 and Chung-Ho Park et al in J. Med. Chem. 1992, 35, 1156-1165. Compounds of the formula Q-Z wherein Z is a urethane may be prepared by 30 the skilled chemist, for example by analogous processes to those described in International Patent Application Publication Nos. WO 97/30995 and WO 97/37980.

A similar reaction to reaction (c) may be performed in which Q-Z wherein Z is a amine group is reacted with the epoxide (optionally in the presence of an organic base), and

- 50 -

the product is reacted with, for example, phosgene to form the oxazolidinone ring. Such reactions and the preparation of starting materials is within the skill of the ordinary chemist with reference to the above-cited documents disclosing analogous reactions and preparations.

Epoxides of the formula (V) may be prepared from the corresponding compound of 5 formula (XII):

(XII)

Certain such epoxide and alkene intermediates are novel and are provided as a further feature of the invention. Asymmetric epoxidation may be used to give the desired optical isomer.

10 Compounds of formula (VI) may be obtained from epoxides of formula (V); alternatively compounds of formula (VI) may be used as precursors for epoxides of formula (V) according to the relative ease of synthesis in each case. The skilled chemist will appreciate that the epoxides of formula (V) and the compounds of formula (VI) are structurally equivalent and the choice between them will be made on the grounds of availability, convenience, and cost.

15 (d) The transition metal catalysed coupling reaction to form a C-C or N-C bond from the corresponding aryl derivatives and the arenes, heteroarenes, olefins, alkynes, or amines is performed under conventional conditions (see for instance J.K. Stille, *Angew. Chem. Int. Ed. Eng.*, 1986, 25, 509-524; N. Miyaura and A. Suzuki, *Chem. Rev.*, 1995, 95, 22457-2483; D. Baranano, G. Mann, and J.F. Hartwig, *Current Org. Che.*, 1997, 1, 287-305; S.P. Stanforth, *Tetrahedron*, 1998, 54, 263-303). The reaction d (ii) may be conveniently carried out under the conditions described *Tetrahedron Letters* (2001), 42(22), 3681-3684, or in the analogous conventional conditions described in the above mentioned literature. In such a procedure a preferred variation of X may be bromine.

20 (e) The cycloaddition reaction to form 1,2,3 triazoles from the corresponding azide is performed under conventional conditions. Compounds of the formula (II) wherein Y is azide may be obtained as described in the references cited herein (particularly in the section proceeding the discussion of protecting groups), for example from the corresponding compounds in which Y is hydroxy or mesylate.

25 (f) The reaction of amines of formula (II, Y = NH₂) with arenesulfonyl hydrazones to form 1,2,3 triazoles may be carried out as described in the literature (Sakai, Kunikazu; Hida, Nobuko; Kondo and Kiyosi "Reactions of α -polyhalo ketone tosylhydrazones with sulfide

- 51 -

ion and primary amines. Cyclization to 1,2,3-thiadiazoles and 1,2,3-triazoles." *Bull. Chem. Soc. Jpn.* (1986), 59(1), 179-83; Sakai, Kunikazu; Tsunemoto, Daiei; Kobori, Takeo; Kondo, Kiyoshi; Hida and Nobuko: "1,2,3-Trihetero 5-membered heterocyclic compounds" EP103840 A2 19840328). The leaving groups Y, Y' may be chloro or any other group 5 capable of being eliminated from the arenesulfonyl hydrazone during the reaction with the amine. The skilled chemist will also appreciate that a similar reaction may be used to produce other substituted triazoles suitable for incorporation into related processes such as reaction with compounds of formula (IV) in process (c).

(g) The reaction of azides of formula (II, Y = N₃) with terminal alkynes using Cu(I) 10 catalysis to give regioselectively 4-substituted 1,2,3-triazole compounds of formula (I) may be carried out as described in the literature (for instance V.V. Rostovtsev, L.G. Green, V.V. Fokin, and K.B. Sharpless, *Angew. Chem. Int. Ed.*, 2002, 41, 2596-2599).

(h) The reaction of alkylazides with 1-halovinylsulfonyl chlorides at a temperature 15 between 0 °C and 100 °C either neat or in an inert diluent such as chlorobenzene, chloroform or dioxan gives 4-halogenated 1,2,3-triazole compounds of formula (I). The reaction may be applied to 1-fluoro-, 1-chloro-, 1-bromo-, or 1-iodo-vinylsulfonylchlorides.

The removal of any protecting groups, the formation of a pharmaceutically-acceptable salt and/or the formation of an *in vivo* hydrolysable ester are within the skill of an ordinary 20 organic chemist using standard techniques. Furthermore, details on the these steps, for example the preparation of in-vivo hydrolysable ester prodrugs has been provided in the section above on such esters, and in certain of the following non-limiting Examples.

When an optically active form of a compound of the formula (I) is required, it may be obtained by carrying out one of the above procedures using an optically active starting 25 material (formed, for example, by asymmetric induction of a suitable reaction step), or by resolution of a racemic form of the compound or intermediate using a standard procedure, or by chromatographic separation of diastereoisomers (when produced). Enzymatic techniques may also be useful for the preparation of optically active compounds and/or intermediates.

Similarly, when a pure regioisomer of a compound of the formula (I) is required, it 30 may be obtained by carrying out one of the above procedures using a pure regioisomer as a starting material, or by resolution of a mixture of the regioisomers or intermediates using a standard procedure.

According to a further feature of the invention there is provided a compound of the

- 52 -

formula (I), or a pharmaceutically-acceptable salt, or in-vivo hydrolysable ester thereof for use in a method of treatment of the human or animal body by therapy.

According to a further feature of the present invention there is provided a method for producing an antibacterial effect in a warm blooded animal, such as man, in need of such 5 treatment, which comprises administering to said animal an effective amount of a compound of the present invention, or a pharmaceutically-acceptable salt, or in-vivo hydrolysable ester thereof.

The invention also provides a compound of the formula (I), or a pharmaceutically-acceptable salt, or in-vivo hydrolysable ester thereof, for use as a medicament; and for use as 10 an anti-bacterial agent; and the use of a compound of the formula (I) of the present invention, or a pharmaceutically-acceptable salt, or in-vivo hydrolysable ester thereof, in the manufacture of a medicament for use in the production of an antibacterial effect in a warm blooded animal, such as man.

In order to use a compound of the formula (I), an in-vivo hydrolysable ester or a 15 pharmaceutically-acceptable salt thereof, including a pharmaceutically-acceptable salt of an in-vivo hydrolysable ester, (hereinafter in this section relating to pharmaceutical composition "a compound of this invention") for the therapeutic (including prophylactic) treatment of mammals including humans, in particular in treating infection, it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition.

20 Therefore in another aspect the present invention provides a pharmaceutical composition which comprises a compound of the formula (I), an in-vivo hydrolysable ester or a pharmaceutically-acceptable salt thereof, including a pharmaceutically-acceptable salt of an in-vivo hydrolysable ester, and a pharmaceutically-acceptable diluent or carrier.

The compositions of the invention may be in a form suitable for oral use (for example 25 as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration as eye-drops, for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral 30 administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, sub-lingual, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

- 53 -

In addition to the compounds of the present invention, the pharmaceutical composition of this invention may also contain (ie through co-formulation) or be co-administered (simultaneously, sequentially or separately) with one or more known drugs selected from other clinically useful antibacterial agents (for example, β -lactams, macrolides, quinolones or 5 aminoglycosides) and/or other anti-infective agents (for example, an antifungal triazole or amphotericin). These may include carbapenems, for example meropenem or imipenem, to broaden the therapeutic effectiveness. Compounds of this invention may also be co-formulated or co-administered with bactericidal/permeability-increasing protein (BPI) products or efflux pump inhibitors to improve activity against gram negative bacteria and 10 bacteria resistant to antimicrobial agents.

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents. A pharmaceutical composition to be dosed intravenously may contain 15 advantageously (for example to enhance stability) a suitable bactericide, antioxidant or reducing agent, or a suitable sequestering agent.

Suitable pharmaceutically acceptable excipients for a tablet formulation include, for example, inert diluents such as lactose, sodium carbonate, calcium phosphate or calcium carbonate, granulating and disintegrating agents such as corn starch or algenic acid; binding 20 agents such as starch; lubricating agents such as magnesium stearate, stearic acid or talc; preservative agents such as ethyl or propyl ρ -hydroxybenzoate; and anti-oxidants, such as ascorbic acid. Tablet formulations may be uncoated or coated either to modify their disintegration and the subsequent absorption of the active ingredient within the 25 gastrointestinal tract, or to improve their stability and/or appearance, in either case, using conventional coating agents and procedures well known in the art.

Compositions for oral use may be in the form of hard gelatin capsules in which the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules in which the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin, or olive oil.

30 Aqueous suspensions generally contain the active ingredient in finely powdered form together with one or more suspending agents, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents such as lecithin or condensation

- 54 -

products of an alkylene oxide with fatty acids (for example polyoxethylene stearate), or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or

5 condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions

10 may also contain one or more preservatives (such as ethyl or propyl p-hydroxybenzoate, anti-oxidants (such as ascorbic acid), colouring agents, flavouring agents, and/or sweetening agents (such as sucrose, saccharine or aspartame).

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil (such as arachis oil, olive oil, sesame oil or coconut oil) or in a mineral oil (such 15 as liquid paraffin). The oily suspensions may also contain a thickening agent such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set out above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by 20 the addition of water generally contain the active ingredient together with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

25 The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil, or a mineral oil, such as for example liquid paraffin or a mixture of any of these. Suitable emulsifying agents may be, for example, naturally-occurring gums such as gum acacia or gum tragacanth, naturally-occurring phosphatides such as soya bean, lecithin, an esters or partial 30 esters derived from fatty acids and hexitol anhydrides (for example sorbitan monooleate) and condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative agents.

- 55 -

Syrups and elixirs may be formulated with sweetening agents such as glycerol, propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable 5 aqueous or oily suspension, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which have been mentioned above. A sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in 1,3-butanediol. Solubility enhancing agents, for example cyclodextrins may be 10 used.

Compositions for administration by inhalation may be in the form of a conventional pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing 15 finely divided solid or liquid droplets. Conventional aerosol propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently arranged to dispense a metered quantity of active ingredient.

For further information on formulation the reader is referred to Chapter 25.2 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The amount of active ingredient that is combined with one or more excipients to 20 produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 50 mg to 5 g of active agent compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will 25 generally contain about 200 mg to about 2 g of an active ingredient. For further information on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

A suitable pharmaceutical composition of this invention is one suitable for oral 30 administration in unit dosage form, for example a tablet or capsule which contains between 1mg and 1g of a compound of this invention, preferably between 100mg and 1g of a compound. Especially preferred is a tablet or capsule which contains between 50mg and 800mg of a compound of this invention, particularly in the range 100mg to 500mg.

- 56 -

In another aspect a pharmaceutical composition of the invention is one suitable for intravenous, subcutaneous or intramuscular injection, for example an injection which contains between 0.1% w/v and 50% w/v (between 1mg/ml and 500mg/ml) of a compound of this invention.

- 5 Each patient may receive, for example, a daily intravenous, subcutaneous or intramuscular dose of 0.5 mgkg^{-1} to 20 mgkg^{-1} of a compound of this invention, the composition being administered 1 to 4 times per day. In another embodiment a daily dose of 5 mgkg^{-1} to 20 mgkg^{-1} of a compound of this invention is administered. The intravenous, subcutaneous and intramuscular dose may be given by means of a bolus injection.
- 10 Alternatively the intravenous dose may be given by continuous infusion over a period of time. Alternatively each patient may receive a daily oral dose which may be approximately equivalent to the daily parenteral dose, the composition being administered 1 to 4 times per day.

In the above other, pharmaceutical composition, process, method, use and medicament manufacture features, the alternative and preferred embodiments of the compounds of the invention described herein also apply.

Biological Activity :

The pharmaceutically-acceptable compounds of the present invention are useful 20 antibacterial agents having a good spectrum of activity in vitro against standard Gram-positive organisms, which are used to screen for activity against pathogenic bacteria. Notably, the pharmaceutically-acceptable compounds of the present invention show activity against enterococci, pneumococci and methicillin resistant strains of *S.aureus* and coagulase 25 negative staphylococci, together with haemophilus and moraxella strains. The antibacterial spectrum and potency of a particular compound may be determined in a standard test system.

The (antibacterial) properties of the compounds of the invention may also be demonstrated and assessed in-vivo in conventional tests, for example by oral and/or intravenous dosing of a compound to a warm-blooded mammal using standard techniques.

The following results were obtained on a standard in-vitro test system. The activity 30 is described in terms of the minimum inhibitory concentration (MIC) determined by the agar-dilution technique with an inoculum size of 10^4 CFU/spot. Typically, compounds are active in the range 0.01 to 256 $\mu\text{g/ml}$.

- 57 -

Staphylococci were tested on agar, using an inoculum of 10^4 CFU/spot and an incubation temperature of 37°C for 24 hours - standard test conditions for the expression of methicillin resistance.

Streptococci and enterococci were tested on agar supplemented with 5% defibrinated horse blood, an inoculum of 10^4 CFU/spot and an incubation temperature of 37°C in an atmosphere of 5% carbon dioxide for 48 hours - blood is required for the growth of some of the test organisms. Fastidious Gram negative organisms were tested in Mueller-Hinton broth, supplemented with hemin and NAD, grown aerobically for 24 hours at 37°C, and with an inoculum of 5×10^4 CFU/well.

For example, the following results were obtained for the compound of Example 3 :

<u>Organism</u>	<u>MIC (µg/ml)</u>	
Staphylococcus aureus:	MSQS	4
	MRQR	8
Streptococcus pneumoniae		2
Streptococcus pyogenes		2
Haemophilus influenzae		2
Moraxella catarrhalis		4

MSQS = methicillin sensitive and quinolone sensitive

MRQR = methicillin resistant and quinolone resistant

The activity of the compounds of the invention against MAO-A was tested using a standard in-vitro assay based on human liver enzyme expressed in yeast as described in Biochem. Biophys. Res. Commun. 1991, 181, 1084-1088. The compounds of the invention showed decreased MAO-A potency compared with analogues from the known art with C-5 side chains such as acetamidomethyl or unsubstituted azolylmethyl or hydroxymethyl. The compounds of the invention showed decreased MAO-A potency compared with analogues in which the HET group of formula (Ia) to (If) is unsubstituted. When Ki values were measured in such an assay as above, Example 3 showed a Ki value of $> 177 \mu\text{g/ml}$.

MAO activity in general comprises activity in both MAO-A and MAO-B enzymes. The compounds of the invention in general demonstrate favourable profiles against both enzymes.

Certain intermediates and/or Reference Examples described hereinafter within the scope of the invention may also possess useful activity, and are provided as a further feature of the

invention.

The invention is now illustrated but not limited by the following Examples in which unless otherwise stated :-

(i) evaporation were carried out by rotary evaporation in vacuo and work-up procedures 5 were carried out after removal of residual solids by filtration;

(ii) operations were carried out at ambient temperature, that is typically in the range 18-26°C and without exclusion of air unless otherwise stated, or unless the skilled person would otherwise work under an inert atmosphere;

(iii) column chromatography (by the flash procedure) was used to purify compounds and 10 was performed on Merck Kieselgel silica (Art. 9385) unless otherwise stated;

(iv) yields are given for illustration only and are not necessarily the maximum attainable;

(v) the structure of the end-products of the invention were generally confirmed by NMR and mass spectral techniques [proton magnetic resonance spectra were generally determined in DMSO-d₆ unless otherwise stated using a Varian Gemini 2000 spectrometer operating at a 15 field strength of 300 MHz, or a Bruker AM250 spectrometer operating at a field strength of 250 MHz; chemical shifts are reported in parts per million downfield from tetramethylsilane as an internal standard (δ (delta) scale) and peak multiplicities are shown thus: s, singlet; d, doublet; AB or dd, doublet of doublets; dt, doublet of triplets; dm, doublet of multiplets; t, triplet, m, multiplet; br, broad; fast-atom bombardment (FAB) mass spectral data were 20 generally obtained using a Platform spectrometer (supplied by Micromass) run in electrospray and, where appropriate, either positive ion data or negative ion data were collected];

(vi) each intermediate was purified to the standard required for the subsequent stage and was characterised in sufficient detail to confirm that the assigned structure was correct; purity was assessed by HPLC, TLC, or NMR and identity was determined by infra-red spectroscopy 25 (IR), mass spectroscopy or NMR spectroscopy as appropriate;

(vii) in which the following abbreviations may be used :-

DMF is N,N-dimethylformamide; DMA is N,N-dimethylacetamide; TFA is trifluoroacetic acid; TLC is thin layer chromatography; HPLC is high pressure liquid chromatography; MPLC is medium pressure liquid chromatography; DMSO is 30 dimethylsulfoxide; CDCl₃ is deuterated chloroform; MS is mass spectroscopy; ESP is electrospray; EI is electron impact; CI is chemical ionisation; APCI is atmospheric pressure chemical ionisation; NOE is nuclear Overhauser effect (NMR experiment); EtOAc is ethyl acetate; MeOH is methanol.

15 (0.33 g, 1 mmol) (Reference Example 1) was dissolved in refluxing toluene (15 ml). 3,3,3-Trifluoro-1-(phenylsulfonyl)-1-propene (0.24 g, 1 mmol) was added and the resulting mixture was refluxed for 12 hours under vigorous stirring. The solvent was removed under vacuum and the crude product was dissolved in methanol/ethylacetate/water (1:1:1, 30 ml). Sodium periodate (0.21 g, 1 mmol) was added, the reaction mixture was stirred at room temperature 20 for 1 hour. It was extracted with dichloromethane (3 x 20 ml), the organic phase was dried over magnesium sulfate and concentrated to dryness. This residue was purified by flash chromatography on silicagel with 5% methanol in dichloromethane to give 100 mg of the title compound, next to 13 mg of the corresponding 5-trifluoromethyl compound.

15 (5R)-3-[4-(1,1-Dioxo-3,6-dihydro-2H-thiopyran-4-yl)-3-fluorophenyl]-5-(azidomethyl)oxazolidin-2-one (0.8 g, 2.2 mmol) (Reference Example 2) and tetrahydro-2-(2-propynyl)oxy-2H-pyran (1.3 ml, 9.2 mmol) were refluxed in toluene (5 ml) overnight. The solvent was evaporated and the residue was filtered over silica gel with dichloromethane/ methanol (20:1) as eluant to give the crude 4- and 5- substituted triazoles in ~ 1:1 ratio. This mixture was dissolved in tetrahydrofuran/ methanol (2:1, 20 ml), acetic acid was added (5 drops) and it was hydrogenated over Pd/C (10%) at normal pressure and room temperature for two days. It was filtered through a 0.45 μM membrane and solvent was removed under vacuum. Chromatography on silica gel with dichloromethane/ methanol (20:1) gave 176 mg 20 (19%) of the title compound as a colourless solid.

The intermediate for this compound was prepared as follows:

(5R)-3-[4-(3,6-Dihydro-1,1-dioxido-2H-thiopyran-4-yl)-3,5-difluorophenyl]-5-(hydroxymethyl)-2-oxazolidinone

10

This compound was prepared according to WO 01/81350 A1, page 96

Example 60: (5R)-3-[4-(1,1-Dioxo-3,6-dihydro-2H-thiopyran-4-yl)-3,5-difluorophenyl]-5-[5-(methylcyano)tetrazol-2-ylmethyl]oxazolidin-2-one

Malonitrile (11g, 0.167 mol), sodium azide (10.8 g, 0.166 mol), and ammonium chloride (8.92 g, 0.167 mol) were suspended in DMF (50 ml) and heated at 80 °C for 16 hours. The mixture was poured into water, acidified with concentrated HCl, and extracted twice with dichloromethane. The combined organic phases were dried over sodium sulfate and

20 evaporated to give an oily brown residue, which yielded crystals upon drying *in vacuo*. The crystals were collected and rinsed with dichloromethane to afford 1*H*-tetrazol-5-ylacetonitrile (CAS# 13616-36-9) as a light brown crystalline solid (2.92 g, 16%).

1*H*-tetrazol-5-ylacetonitrile (0.27 g, 2.48 mmol), (5*R*)-3-[4-(1,1-dioxido-3,6-dihydro-2*H*-thiopyran-4-yl)-3,5-difluorophenyl]-5-(hydroxymethyl)-1,3-oxazolidin-2-one (WO 01/81350 A1) (0.50 g, 1.39 mmol), and triphenylphosphine (0.55 g, 2.1 mmol) were combined in dry

25 tetrahydrofuran (5 ml), and cooled on an ice-water bath. Diisopropylazodicarboxylate (0.41

- 100 -

ml, 2.58 mmol) was added dropwise over several minutes and the mixture was allowed to warm slowly to room temperature with stirring over 16 hours. Methanol (3 ml) was added, followed by evaporation and purification by chromatography on silica gel with 10% to 15% acetonitrile in dichloromethane. The material obtained after chromatography was precipitated from dichloromethane solution with ether to remove residual triphenylphosphine oxide. This gave the title compound as a white powder (0.495 g, 79%).

Example 61: (5R) 3-[4-(1,1-Dioxo-3,6-dihydro-2H-thiopyran-4-yl)-3,5-difluorophenyl]-5-[5-cyclopropyl-2H-tetrazol-2-ylmethyl]oxazolidin-2-one

Cyclopropylcarbonitrile (2 ml, 27 mmol) was added to a solution of trimethylsilylazide (4.3 ml, 32.5 mmol) and trimethylaluminum (16 ml of a 2M toluene solution, 32 mmol) at 0 °C. The cold bath was removed, the mixture was stirred at room temperature for 15 minutes, then warmed to 80 °C for 16 hours. The solution was carefully added to a slurry of ice and 1N HCl, followed by acidification with concentrated HCl and extraction twice with ethyl acetate. The combined organic phases were washed with saturated NaCl, dried over sodium sulfate, and evaporated to yield a solid residue. Trituration with 1:1 hexane: ethyl acetate gave 5-cyclopropyl-1*H*-tetrazole (CAS# 27943-07-3) as a white crystalline solid (1.5 g, 51%).

5-cyclopropyl-1*H*-tetrazole (0.183 g, 1.66 mmol), (5*R*)-3-[4-(1,1-dioxo-3,6-dihydro-2*H*-thiopyran-4-yl)-3,5-difluorophenyl]-5-(hydroxymethyl)-1,3-oxazolidin-2-one (WO 01/81350 A1) (0.30 g, 0.84 mmol), polystyrene-triphenylphosphine (1.73 mmol/g loading: Argonaut Technologies, Inc. Foster City, CA USA, 1.46 g, 2.53 mmol) and diisopropylazodicarboxylate (0.33 ml, 1.68 mmol) were reacted as described for Example 58. Purification was carried out by chromatography on silica gel with 10% acetonitrile in dichloromethane. The material obtained after chromatography was precipitated from dichloromethane solution with ether to yield the title compound as a white powder (0.28 g, 74%).

10 wherein;

(i) the ring system contains 0, 1 or 2 ring nitrogen atoms (and optionally a further O or S ring heteroatom), and when present the ring nitrogen, O or S heteroatom/s are at any position other than as part of the 3-membered ring in (TDb1);

(iii) the ring system is linked via a ring nitrogen atom or a ring sp^3 or sp^2 carbon atom (with

15 the double bond, where appropriate, orientated in either direction) from any position in either ring [other than from a bridgehead position or from an sp^2 carbon atom in the 4-membered ring in (TDb2), (TDb6) and (TDb11)];

- 110 -

(iii) one of the ring carbon atoms at a position not adjacent to the linking position, is replaced (other than when the ring contains an O or S heteroatom) by one of the following groups -NRc- [not at a bridgehead position], >C(H)-NHRc, >C(H)-NRc-(1-4C)alkyl, >C(H)-CH₂-NHRc, >C(H)-CH₂-NRc-(1-4C)alkyl [wherein the hydrogen atom shown in brackets is not present when the replacement is made at a bridgehead position and wherein a central -CH₂- chain link is optionally mono- or di-substituted by (1-4C)alkyl]; with the proviso that when the ring system is linked via a ring nitrogen atom or an sp² carbon atom any replacement of a ring carbon atom by -NRc-, O or S is at least two carbon atoms away from the linking position; and

10 (iv) the ring system is optionally (further) substituted on an available ring carbon atom as for the bicyclic spiro-ring systems described in (TDa); and Rc is selected from groups (Rc1) to (Rc5) defined hereinafter; or

- 113 -

AR2a, AR2b and Rj is hydrogen or (1-6C)alkyl;

wherein

AR1 is an optionally substituted phenyl or optionally substituted naphthyl;

AR2 is an optionally substituted 5- or 6-membered, fully unsaturated (i.e with the maximum degree of unsaturation) monocyclic heteroaryl ring containing up to four heteroatoms

independently selected from O, N and S (but not containing any O-O, O-S or S-S bonds), and linked via a ring carbon atom, or a ring nitrogen atom if the ring is not thereby quaternised;

AR2a is a partially hydrogenated version of AR2 (i.e. AR2 systems retaining some, but not the full, degree of unsaturation), linked via a ring carbon atom or linked via a ring nitrogen

10 atom if the ring is not thereby quaternised;

AR2b is a fully hydrogenated version of AR2 (i.e. AR2 systems having no unsaturation), linked via a ring carbon atom or linked via a ring nitrogen atom;

AR3 is an optionally substituted 8-, 9- or 10-membered, fully unsaturated (i.e with the maximum degree of unsaturation) bicyclic heteroaryl ring containing up to four heteroatoms

15 independently selected from O, N and S (but not containing any O-O, O-S or S-S bonds), and linked via a ring carbon atom in either of the rings comprising the bicyclic system;

AR3a is a partially hydrogenated version of AR3 (i.e. AR3 systems retaining some, but not the full, degree of unsaturation), linked via a ring carbon atom, or linked via a ring nitrogen atom if the ring is not thereby quaternised, in either of the rings comprising the bicyclic

20 system;

AR3b is a fully hydrogenated version of AR3 (i.e. AR3 systems having no unsaturation), linked via a ring carbon atom, or linked via a ring nitrogen atom, in either of the rings comprising the bicyclic system;

AR4 is an optionally substituted 13- or 14-membered, fully unsaturated (i.e with the maximum degree of unsaturation) tricyclic heteroaryl ring containing up to four heteroatoms

25 independently selected from O, N and S (but not containing any O-O, O-S or S-S bonds), and linked via a ring carbon atom in any of the rings comprising the tricyclic system;

AR4a is a partially hydrogenated version of AR4 (i.e. AR4 systems retaining some, but not the full, degree of unsaturation), linked via a ring carbon atom, or linked via a ring nitrogen

30 atom if the ring is not thereby quaternised, in any of the rings comprising the tricyclic system;

CY1 is an optionally substituted cyclobutyl, cyclopentyl or cyclohexyl ring;

CY2 is an optionally substituted cyclopentenyl or cyclohexenyl ring;

12. A pro-drug of a compound as claimed in any one of the previous claims.

13. A method for producing an antibacterial effect in a warm blooded animal which
5 comprises administering to said animal an effective amount of a compound of the invention as
claimed in any one of claims 1 to 11, or a pharmaceutically-acceptable salt, or in-vivo
hydrolysable ester thereof.

14. A compound of the invention as claimed in any one of claims 1 to 11, or a
10 pharmaceutically-acceptable salt, or in-vivo hydrolysable ester thereof, for use as a
medicament.

15. The use of a compound of the invention as claimed in any one of claims 1 to 11, or a
pharmaceutically-acceptable salt, or in-vivo hydrolysable ester thereof, in the manufacture of
15 a medicament for use in the production of an antibacterial effect in a warm blooded animal.

16. A pharmaceutical composition which comprises a compound of the invention as
claimed in any one of claims 1 to 11, or a pharmaceutically-acceptable salt or an in-vivo
hydrolysable ester thereof, and a pharmaceutically-acceptable diluent or carrier.

20

17. A process for the preparation of a compound of formula (I) as claimed in claim 1 or
pharmaceutically acceptable salts or in-vivo hydrolysable esters thereof, which process
comprises one of processes (a) to (h);

(a) by modifying a substituent in, or introducing a new substituent into, the substituent
25 group R1 of HET of another compound of formula (I);

(b) by reaction of a compound of formula (II) :

(II)

wherein Y is a displaceable group with a compound of the formula (III) :

- 122 -

HET

(III)

wherein HET (of formula (Ia) to (If), already substituted and optionally protected) is HET-H free-base form or HET- anion formed from the free base form; or

5 (c) by reaction of a compound of the formula (IV) :

Q-Z

(IV)

wherein Z is an isocyanate, amine or urethane group with an epoxide of the formula (V); or with a related compound of formula (VI) where

10 the hydroxy group at the internal C-atom is conventionally protected and where the leaving group Y at the terminal C-atom is a conventional leaving group; or

(V)

(VI)

(d) (i) by coupling, using catalysis by transition metals such as palladium(0), of a compound 15 of formula (VII) :

(VII)

wherein Y' is a group HET as hereinbefore defined, X is a replaceable substituent;

with a compound of the formula (VIII), or an analogue thereof, which is suitable to give a T

20 substituent as defined by (TA) -(TE), in which the link is via an sp^2 carbon atom (D = CH=C-Lg where Lg is a leaving group; or as in the case of reactions carried out under Heck reaction conditions Lg may also be hydrogen) or in which the link is via an N atom (D = NH)

(VIII)

25 where T₁ and T₂ may be the same or different or may together with D form a ring of type T;

- 123 -

(d) (ii) by coupling, using catalysis by transition metals such as palladium(0), of a compound of formula (VIIA):

(VIIA)

5 wherein Y' is a group HET as hereinbefore defined, with a compound [Aryl]-X, where X is a replaceable substituent;

(e) Where N-HET is 1,2,3-triazole by cycloaddition via the azide (wherein Y in (II) is azide), with a substituted acetylene or a masked acetylene;

(f) Where N-HET is 1,2,3-triazole by reaction of a compound of formula (II) where Y = 10 NH₂ (primary amine) with a compound of formula (IX), namely the arenesulfonylhydrazone of a methyl ketone that is further geminally substituted on the methyl group by two substituents (Y' and Y'') capable of being eliminated from this initial, and the intermediate, substituted hydrazones as HY' and HY'' (or as conjugate bases thereof);

15

(II : Y = NH₂)

(IX)

(g) where N-HET is 1,2,3-triazole regioselective synthesis may be carried out by cycloaddition via the azide (wherein Y in (II) is azide) with a terminal alkyne using Cu(I) catalysis to give 4-substituted 1,2,3-triazoles;

20

(II : Y = N₃)

(XIII)

(h) where N-HET is 1,2,3-triazole regioselective synthesis may be carried out by cycloaddition via the azide (wherein Y in (II) is azide) with an alpha-halovinylsulfonylchloride (XIII);

- 124 -

and thereafter if necessary: (i) removing any protecting groups; (ii) forming a pharmaceutically-acceptable salt; (iii) forming an in-vivo hydrolysable ester.

INTERNATIONAL SEARCH REPORT

national application No.
PCT/GB 03/00791

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

Although claim 13 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. Claims Nos.: 1-10, 12-17 (all partly) because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

see FURTHER INFORMATION sheet PCT/ISA/210
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-10, 12-17 (all partly)

Present claims 1-10 and 12-17 relate to an extremely large number of possible compounds. In fact, the claims contain so many variables that a lack of clarity and conciseness within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible.

Moreover, there are some inconsistencies in the claims which make them unclear (listing may not be exhaustive):

In claim 6, R1 can also be hydrogen, which is not the case in the corresponding independent claim 1.

According to claim 1, (TC) can be (TC1), (TC2), (TC3) and (TC4).

Therefore the following groups, mentioned in the dependent claims, apparently are not defined:

In claims 7 and 8: (TC5), (TC7), (TC9), (TC12), (TC13).

In claims 9 and 10: ((TC12a), (TC12b)).

The term "pro-drug", as mentioned in claim 12, is not defined properly and thus unclear.

Support within the meaning of Article 6 PCT and disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds of claim 11 and to the examples.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
